## ARITHMETIC PROGRESSION

- Sequence (Progression): A group of numbers forming a pattern
- Arithmetic Progression (A.P.): A progression in which each term, except the first, is obtained by adding a constant to the previous term. Its terms are denoted by $\mathrm{t}_{1}, \mathrm{t}_{2}, \mathrm{t}_{3}, \ldots \mathrm{t}_{\mathrm{n}}$, or $a_{1}, a_{2}, a_{3}, \ldots . . . a_{n}$.
A squence is called an arithmetic progression, if there exists a constant $d$ such that $\mathrm{a}_{2}-\mathrm{a}_{1}=\mathrm{d}$ , $a_{3}-a_{2}=d, a_{4}-a_{3}=d, \ldots . . a_{n+1}-a_{n}=d$ and so on. d is called the common difference.
- Formation of A.P. or General form of A.P.: If ' $a$ ' is the first term and ' $d$ ' is the common difference of an A.P., then A.P. is $\mathrm{a}, \mathrm{a}+\mathrm{d}, \mathrm{a}+$ 2d, a + 3d, a + 4d, ....
- ' $\mathbf{n}$ ' th term of A.P.: The nth term of the A.P. a,
$a+d, a+2 d, \ldots$ is given by $t_{n}=a+(n-1) d$. Sometimes nth term is also denoted by $\mathrm{a}_{\mathrm{n}}$.
- Sum of first $n$ terms of an A.P.: The sum of first $n$ terms of an A.P. is $S_{n}=\frac{n}{2}(a+1)$, where 1 (last term $)=a+(n-1) d, a=$ first term, $\mathrm{d}=$ common difference, $\mathrm{n}=$ no. of terms $\therefore \mathrm{s}_{\mathrm{n}}=\frac{\mathrm{n}}{2}[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]$
- $\mathbf{n}^{\text {th }}$ term in terms of $\mathrm{s}_{\mathrm{n}}$ : If $\mathrm{s}_{\mathrm{n}}$ is the sum of the first $n$ terms of an A.P., then the nth term is given by $\mathrm{t}_{\mathrm{n}}=\mathrm{S}_{\mathrm{n}}-\mathrm{S}_{\mathrm{n}-1}$.
- Various terms of an A.P.: 3 consecutive terms are $a-d, a, a+d$ and common difference is $d$. 4 consecutive terms are $\mathrm{a}-3 \mathrm{~d}, \mathrm{a}-\mathrm{d}, \mathrm{a}+\mathrm{d}$, a +3 d and common difference is 2 d .
