## GRAVITATION

## LAW OF GRAVITATION

- Every particle attracts every other particle in the universe with a force which varies as the product of their masses and inversely as the square of the distance between them.

$$
\begin{gathered}
F \propto \frac{m_{1} m_{2}}{r^{2}} \\
F=G \frac{m_{1} m_{2}}{r^{2}}
\end{gathered}
$$

- In vector form

$$
\begin{gathered}
\boldsymbol{F}_{\mathbf{1 2}}=G \frac{m_{1} m_{2}}{r_{12}^{2}} \widehat{r_{12}} \\
\boldsymbol{F}_{\mathbf{2 1}}=-G \frac{m_{1} m_{2}}{r_{12}^{2}} \widehat{r_{12}} \\
\boldsymbol{F}_{\mathbf{1 2}}=-\boldsymbol{F}_{\mathbf{2 1}}
\end{gathered}
$$

- The constant of proportionality G , is called the universal constant of gravitation.
- Value of $G$ is $6.67 \times 10^{-11} \mathrm{Nm}^{2} \mathrm{~kg}^{-2}$
- Its value remains the same between any two objects everywhere

## ACCELERATION DUE TO GRAVITY

F $=$ ma(By Newton's second law)
$\mathrm{F}=G \frac{m M}{r^{2}}$ (By law of gravitation)

$$
\mathrm{a}=\mathrm{g}=G \frac{M}{r^{2}}
$$

VARIATION IN THE VALUE OF G

## - Variation with Height

the magnitude of $g$ decreases as square of the distance from the centre of the earth increases

$$
g_{h}=\frac{G M}{R^{2}\left(1+\frac{h}{R}\right)^{2}}
$$

## - Variation of $\mathbf{g}$ with Depth

The value of $g$ decreases as we go below the earth

$$
g_{d} \frac{4 \pi G}{3} \rho(R-d)
$$

## - Variation of $\mathbf{g}$ with Latitude

$$
g_{\lambda}=\boldsymbol{g}-\boldsymbol{R} \omega^{2} \cos \lambda
$$

Where $g_{\lambda}$ is gravity at latitude, $g$ value of gravity at pole, $\omega$ angular velocity of earth , R radius of earth.

## WEIGHT AND MASS

- The force with which a body is pulled towards the earth is called its weight. If $m$ is the mass of the body, then its weight W is given by $\mathrm{W}=\mathrm{mg}$
- It's unit is newton.
- Since g varies from place to place, weight of a body also changes from place to place
- The weight is maximum at the poles and minimum at the equator
- The mass of a body, however, does not change. Mass is an intrinsic

# Senior Secondary Course Learner's Guide, Physics (312) 

property of a body. Therefore, it stays constant wherever the body may be situated

## Gravitational Potential and Potential energy

Gravitational Potential (V) of mass M is defined as the gravitational potential energy of unit mass. Hence,

$$
\begin{gathered}
\mathrm{dU}=-\mathrm{F} . \mathrm{dr} \\
\mathrm{dU}=\frac{G m M}{r^{2}} d r \\
\mathrm{U}=\mathrm{GMm} \int_{\infty}^{r} \frac{1}{r^{2}} d r
\end{gathered}
$$

## Kepler's Laws Of Planetary Motion

1: The orbit of a planet is an ellipse with the Sun at one of the foci (An ellipse has two foci.)

2: The area swept by the line joining the planet to the sun in unit time is constant throughout the orbit.

3: The square of the period of revolution of a planet around the sun is proportional to the cube of its average distance from the Sun. If we denote the period by T and the average distance from the Sun as r ,

$$
T^{2} \propto r^{3}
$$

Orbital Velocity of Planets

$$
\begin{gathered}
v_{o r b}=\frac{2 \pi r}{T} \\
v_{o r b}=\sqrt{\frac{G M_{s}}{r^{2}}}
\end{gathered}
$$

## ESCAPE VELOCITY

It is defined as the minimum velocity required by an object to escape the gravitational pull of the earth

$$
v_{\text {esc }}=\sqrt{\frac{2 G M}{R}}
$$

## ARTIFICIAL SATELLITES

| Polar Orbit | Equatorial orbit |
| :--- | :--- | ---: |
| Satellite used for <br> remote sensing | Satellite used for <br> communication |
| Altitude is 800 km | Height is fixed at <br> around 3600 km |
| Time period is 100 <br> min | Time period of <br> rotation is 24 hour |

## CHECK YOURSELF

1. Dimension of gravitational constant G.
A. $\mathrm{M}^{-1} \mathrm{~L}^{3} \mathrm{~T}^{-2}$
B. $\mathrm{M}^{-1} \mathrm{~L}^{3} \mathrm{~T}^{-1}$
C. $\mathrm{M}^{-1} \mathrm{~L}^{2} \mathrm{~T}^{-2}$
D. $\mathrm{ML}^{3} \mathrm{~T}^{-2}$
2. Value of g at $\lambda=60^{\circ}$, radius of earth is 6371 km
A. $9.836 \mathrm{~ms}^{-2}$
B. $9.8 \mathrm{~ms}^{-2}$
C. $9.7 \mathrm{~ms}^{-2}$
D. $9.836 \mathrm{~ms}^{-2}$
3. S.I. unit of gravitational potential
A. $\mathrm{Jkg}^{-1}$
B. Jkg
C. $\mathrm{J}^{-1} \mathrm{~kg}$
D. $(\mathrm{Jkg})^{-2}$
4. Mass of earth is $5.97 \mathrm{x} 10^{24} \mathrm{~kg}$ and its radius is 6371 km escape velocity from earth is
A. $11.3 \mathrm{~ms}^{-1}$
B. $11.3 \mathrm{kms}^{-1}$
C. $11.9 \mathrm{kms}^{-1}$
D. $11.9 \mathrm{~ms}^{-1}$
5. The atmosphere around the earth is held by
A. Gravity
B. Winds
C. Clouds
D. None of the above

## STRETCH YOURSELF

1. Why is gravitational potential energy always negative? Explain
2. A boy is weightless at the center of earth why?
3. At what depth would the value of $g$ be $50 \%$ of what it is on the surface of the earth?
4. Obtain an expression for the orbital velocity of a satellite orbiting the earth.
5. A polar satellite is placed at a height of 1000 km from earth surface. Calculate its orbital period and orbital velocity.
